

Polypropylene Filler

Calcium carbonate **RPP Filler** is a widely utilized additive in the plastic industry, created by blending calcium carbonate particles with **Polypropylene Resin**. This **Filler** enhances various properties of **Polypropylene**, including stiffness, strength, impact resistance, and surface finish. Additionally, it serves as a cost-effective solution by reducing the amount of virgin **Polypropylene** required. For instance, instead of using 100% virgin **PP**, manufacturers can incorporate 20% **Filler** and only 80% or less virgin polymer, effectively lowering production costs while maintaining product performance.
